

Real subject-6 staged reconstructions

PSEUDO-REFERENCE – the PVI Newton image is not anatomical ground truth. No Dice or vessel-truth claim transfers to this figure.

Real subject-6 PVI comparison: the reference is a Newton reconstruction, not anatomical truth

Sample	main L_r	difference L_r	Sample	main L_r	difference L_r	Sample	main L_r	difference L_r	Sample	main L_r	difference L_r
0	0.01014	0.01011	3	0.03780	0.04327	6	0.02764	0.03773	9	0.01284	0.01171

Main scale is shared by pseudo-reference, LM, and GCNM panels in a row; the final difference panel uses the listed difference scale. Values are in S/m.

Takeaway. Four deterministic held-out subject-6 phases compare the PVI Newton pseudo-reference, two iterative-LM stages, two faithful GCNM stages, and the final difference from the pseudo-reference. Stage 2 drifts visibly on real data; this is evidence of synthetic-to-real distribution shift, not evidence that either reconstruction is anatomically correct.

Purpose. Makes the real-domain stage-2 drift visible and pairs with the voltage-residual analysis used to motivate physics-aware early stopping.
