

Cross-domain visual comparison

PSEUDO-REFERENCE – descriptive smoke-pack comparison only; these images are not independent anatomical test evidence.

Earlier PVI-distillation outputs across one cardiac period
(PVI and Newton are reconstructions, not anatomical ground truth)

shared output scale: ± 0.0155 ; difference scale: ± 0.0099

-0.0155  $+0.0155$
 Shared PVI/Newton/GCN $\Delta\sigma$ (S/m)

-0.0099  $+0.0099$
 GCN - PVI (S/m)

Takeaway. Four cardiac phases compare the archived MATLAB PVI image, the reproduced production-Newton pseudo-label, the earlier GCN output, and GCN minus archived PVI. The port agrees closely with archived PVI, while the GCN smooths and attenuates the image. Descriptive only: these samples belong to the smoke train/validation pack.

Purpose. Shows production parity and the qualitative cross-domain effect of the earlier learned model without presenting the PVI reconstruction as ground truth.
